

If you're a music-holic and would love to tell the world about your taste in music, what better way to do that than having your [iOS 5](#) device tweet your current song playing, in no time at all using the built in Twitter integration. No need to type in, press a certain key, see what you're about to send and voila! How? TweetSong is a new [Cydia](#) [tweak](#) that will easily let you do all this, in a matter of a few seconds. The tweak will pull in the information for the current playing song straight from your Music app, using it as the body of your tweet.

TweetSong works by assigning a shortcut to it via Activator, and once set, all you need to do is to launch the tweak via the shortcut, resulting in a pre written tweet containing your current song title, along with the artist.
