

FileProcessor is an application that searches for files based on user-defined preferences, and lets you perform a variety of tasks on them. It lets you perform actions such as delete, compare, rename, copy, run, print etc, on the [search](#) results. You can perform batch actions, save search lists, load them and print search results from within the application. The application lets you search your [hard disk](#) with *Size*, *Time* and *Period filters*, and provides a number of predefined file type filters such as BMP, EXE, PDF, TXT, HTML, RES, DLL, SQL etc.

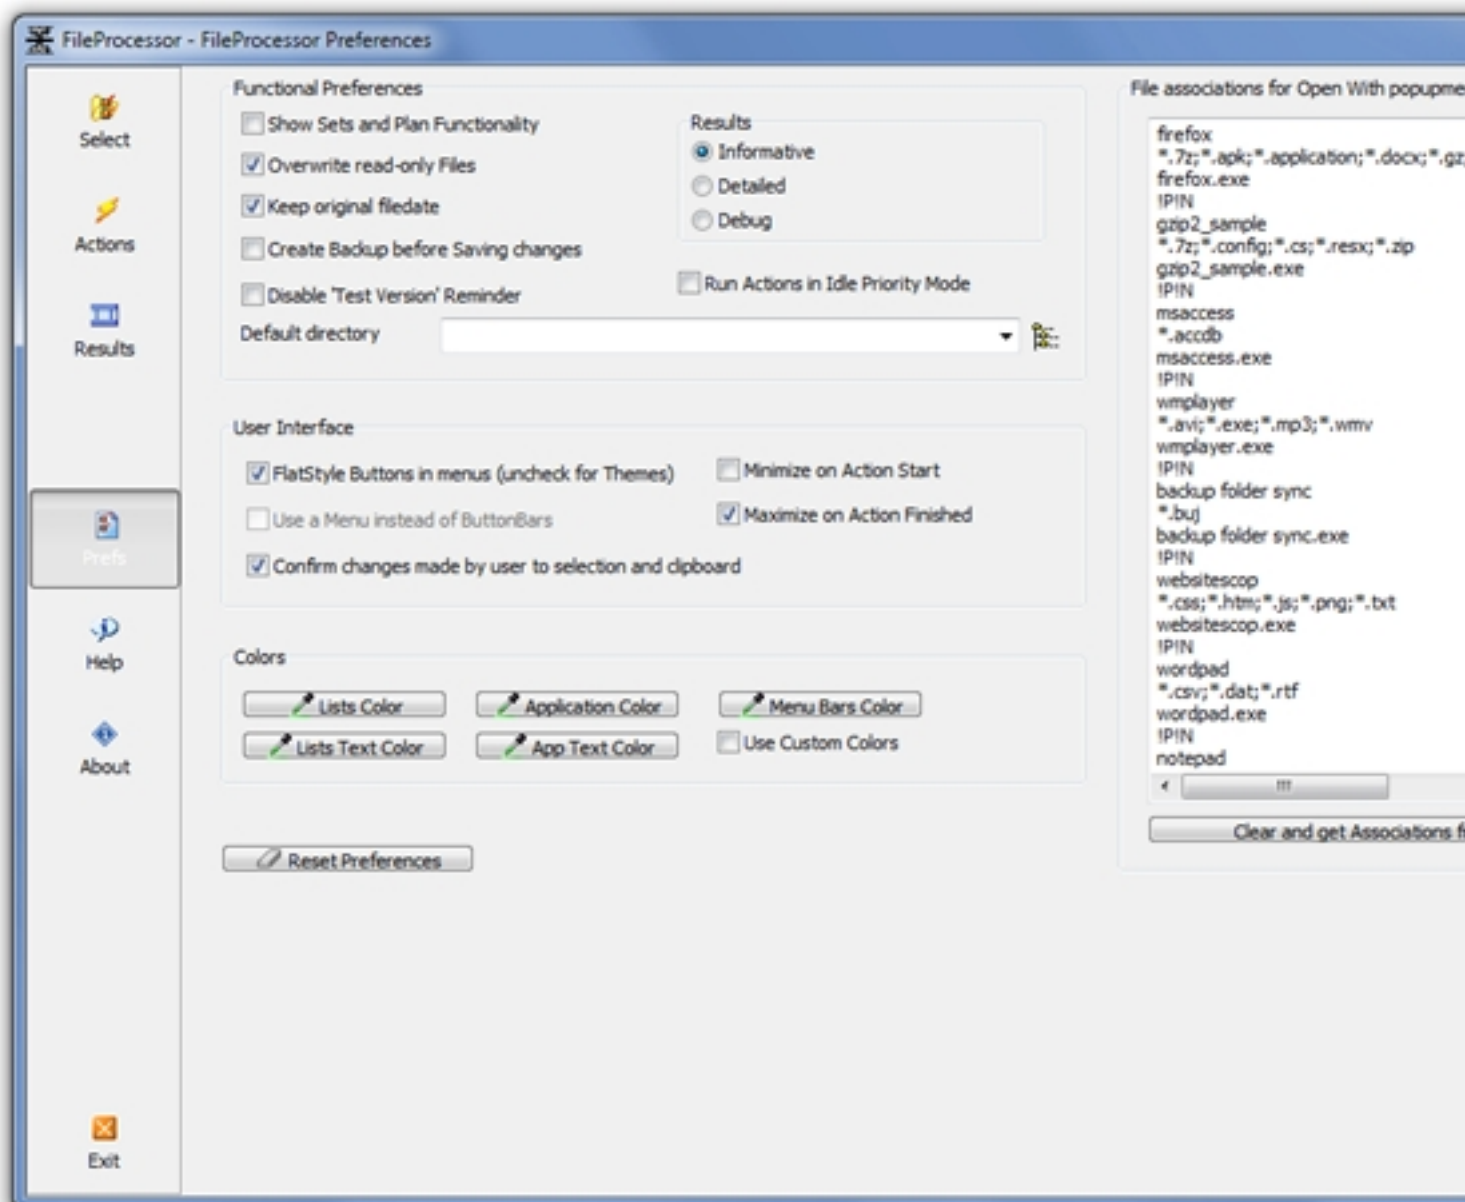

To start searching, first select a *Starting Directory*. Choose the *Size*, *Time* and *PeriodFilters* from the top left, and *File Type Filters* from the top right of the interface. Click *Search & Add* button to start searching for your desired results. The *Search & Remove* option lets you remove particular types of items from the search results; just select the filters and click *Search & Remove* to delete items.

Click on the right side of the results to perform actions, Print, Set Properties search results. You can Del

Click on the "Rename" button in the preferences panel of FileProcessor. You can set *Fun*
tionality *options* *to* *change* *on* *Action* *Finished*
