

URL shorteners like bit.ly or tinyurl aren't new. They have become increasingly popular for sharing links on social media, especially Twitter. For the uninitiated, these services simply make long hyperlinks much shorter, allowing you to share them without worrying much about character limit. Many popular link shorteners can also monitor different analytics such as click counts and offer link customization. Google runs a URL shortening service called Goo.gl but the search giant is yet to offer an official Android client. Until then, you can use the third party **Google URL Shortener** for the purpose.

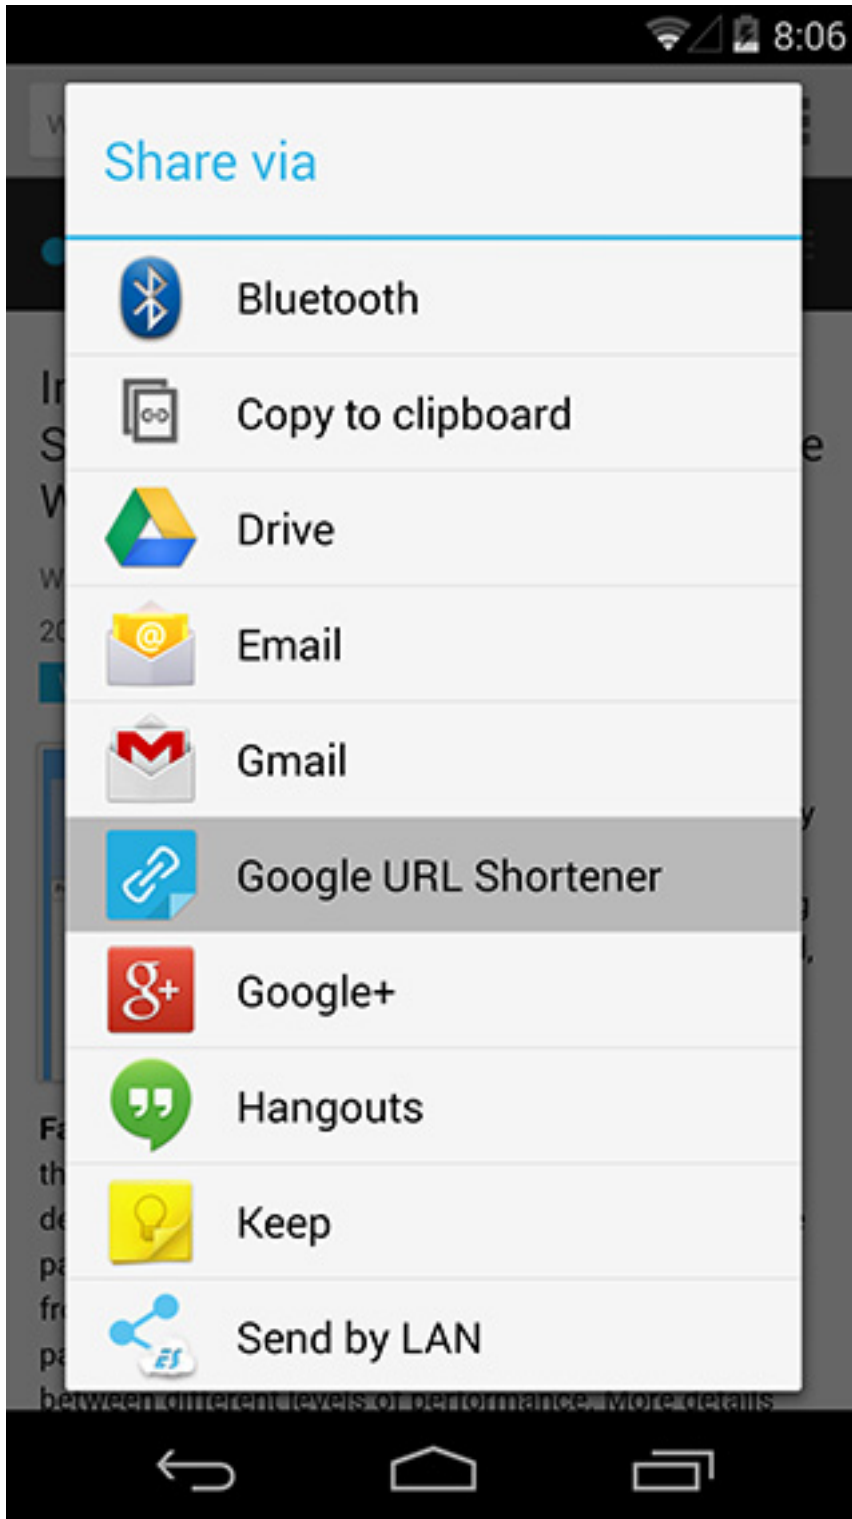

The app simply enables you to use Goo.gl right on your mobile device, allowing you sign in to your account, monitor stats, and shorten links on the go.

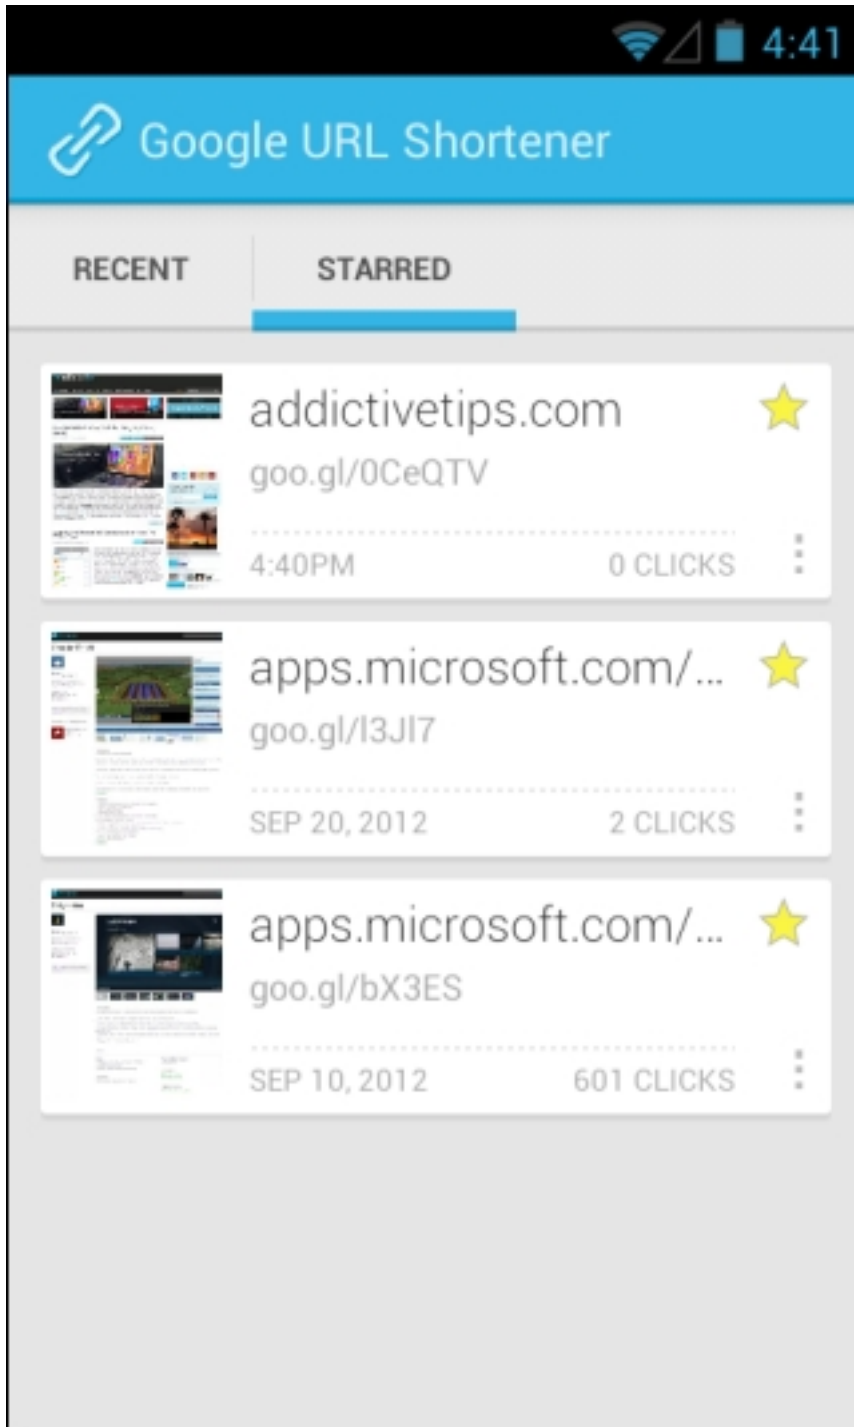

When you launch the app for the first time, you're asked to sign in to your Google account. Past that, the app displays its home screen, which is divided into Recent and Starred tabs. Previously shortened links appear under Recent, while all favorited links are sent to the Starred section.
