

I must confess I'm a die-hard music fan and the avid music listener inside me only loves hearing the crisp sounds from top notch hardware equipment. Sometimes, however, poor optimization on the software side can lead to an abysmal listening experience; some of the sound quality may be lost and other times the distorted audio so badly that it's not even worth listening to at all. Luckily, the Google Play Store has some really nice equalizers that improve sound quality and clarity of songs in a snap. **Floating Equalizer** is one such free app that lets you adjust different sound equalization settings.

The good bit about Floating Equalizer is that it works really well across a range of music apps. And even though the major Android music players ship with an equalizer out of the box, Floating Equalizer can prove useful with those that don't such as the official YouTube application. Besides YouTube, the app works with Google Music, Tunein, MX Player and Spotify without any issues. In short, it lets you enhance quality of sound no matter which app it being played from.
