

Snap2 HTML is a [portable](#) application that lets you take create an [HTML](#) snapshot of folder structures on your hard drive. The [snapshot](#)

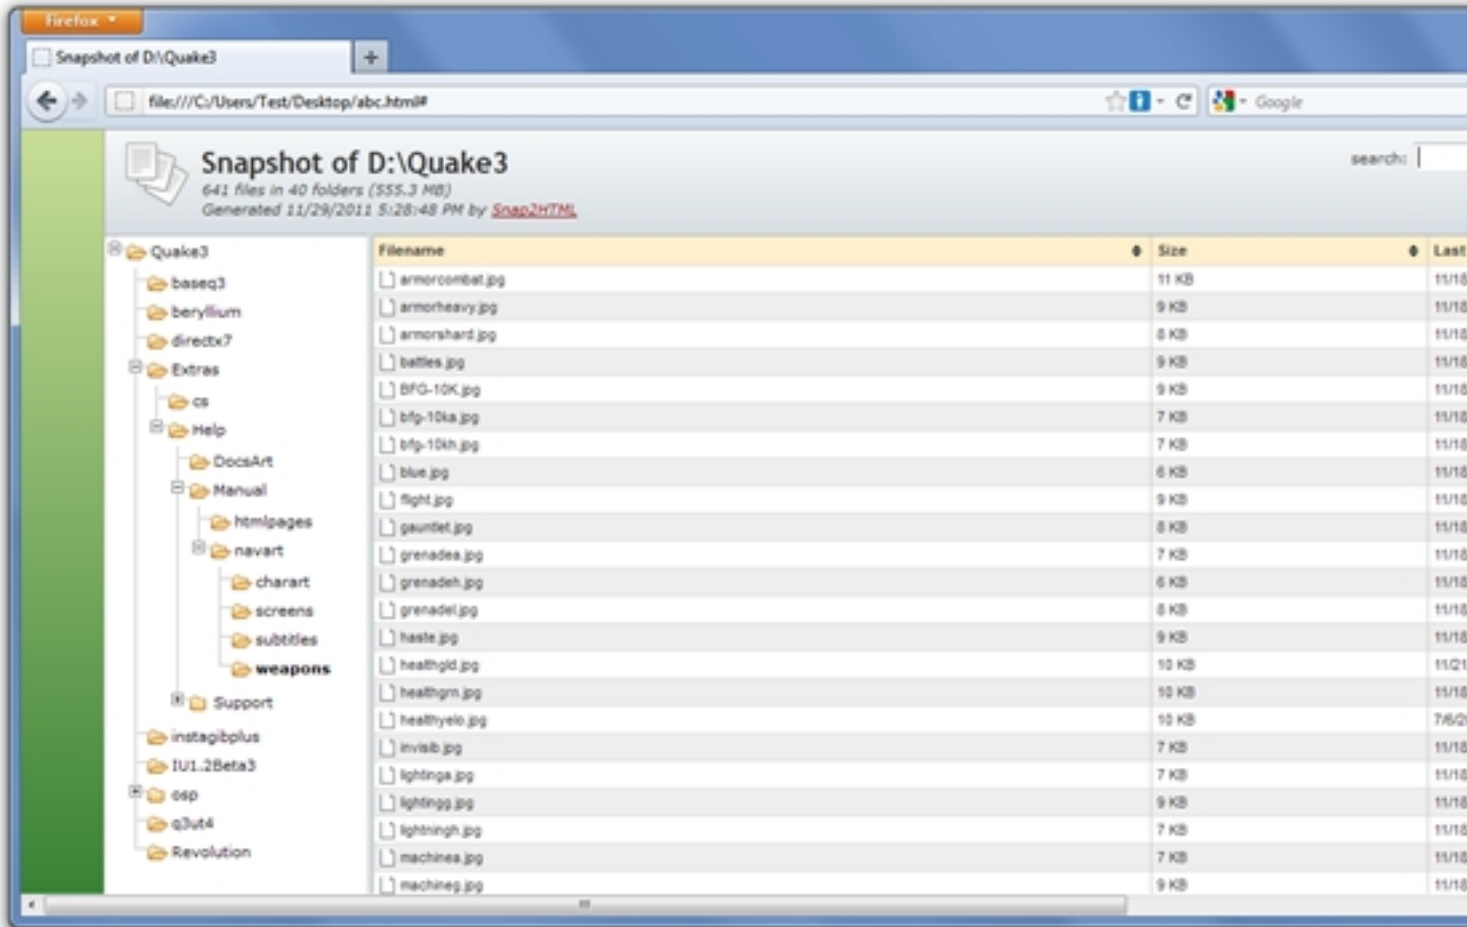

is a complete copy of the real file and folder structure, and the user is able to navigate within them just like a real directory. This snapshot of folder structure can then be shared with anyone, allowing them to view where each file and folder is in the parent folder. This can be extremely useful in situations where tech support is required. The HTML file is created with a built-in search function that allows you to search any file and folder by name or extension.

To create an HTML snapshot of a folder, enter the folder path by clicking the Root Folder button. Select if you want to include the *Hidden* and *System* objects in your folder tree. When everything is set, click *Create Folder Snapshot*, and enter a path and name for the HTML file.

Once the HTML file is created, you can view the list of files and folders according to *File Name*, *Size*, and *Last Modified*

attributes. The top left corner displays the parent folder name, total number of files and folders, total size of the folder, and date and time when the snapshot was generated. You can navigate among the folders from the left pane, while the details appear on right side. There is a *Search* field available in the top right corner that can be used to search for items included in the folder structure.

Snap2HTML works on Windows XP, Windows Vista and Windows 7. Testing was done on Windows 7 64-bit operating system.
