

Different applications leave numerous useless files, such as logs and temporary files, in your PC when you install and uninstall them. Other Windows functions such as Windows update and downloaded installations also leave some files behind. These unnecessary files and folders clutter up your hard drive, causing a decrease in PC [performance](#) . **UnCleaner** is an application that displays a file report detailing all junk files, and [cleans](#) them in one go. The application allows you to set task scheduler to enable system cleaning on every startup. Some of the files that it cleans include Windows account temp files, Windows updates downloaded files, Windows installer temp files, Windows shell cached files etc.

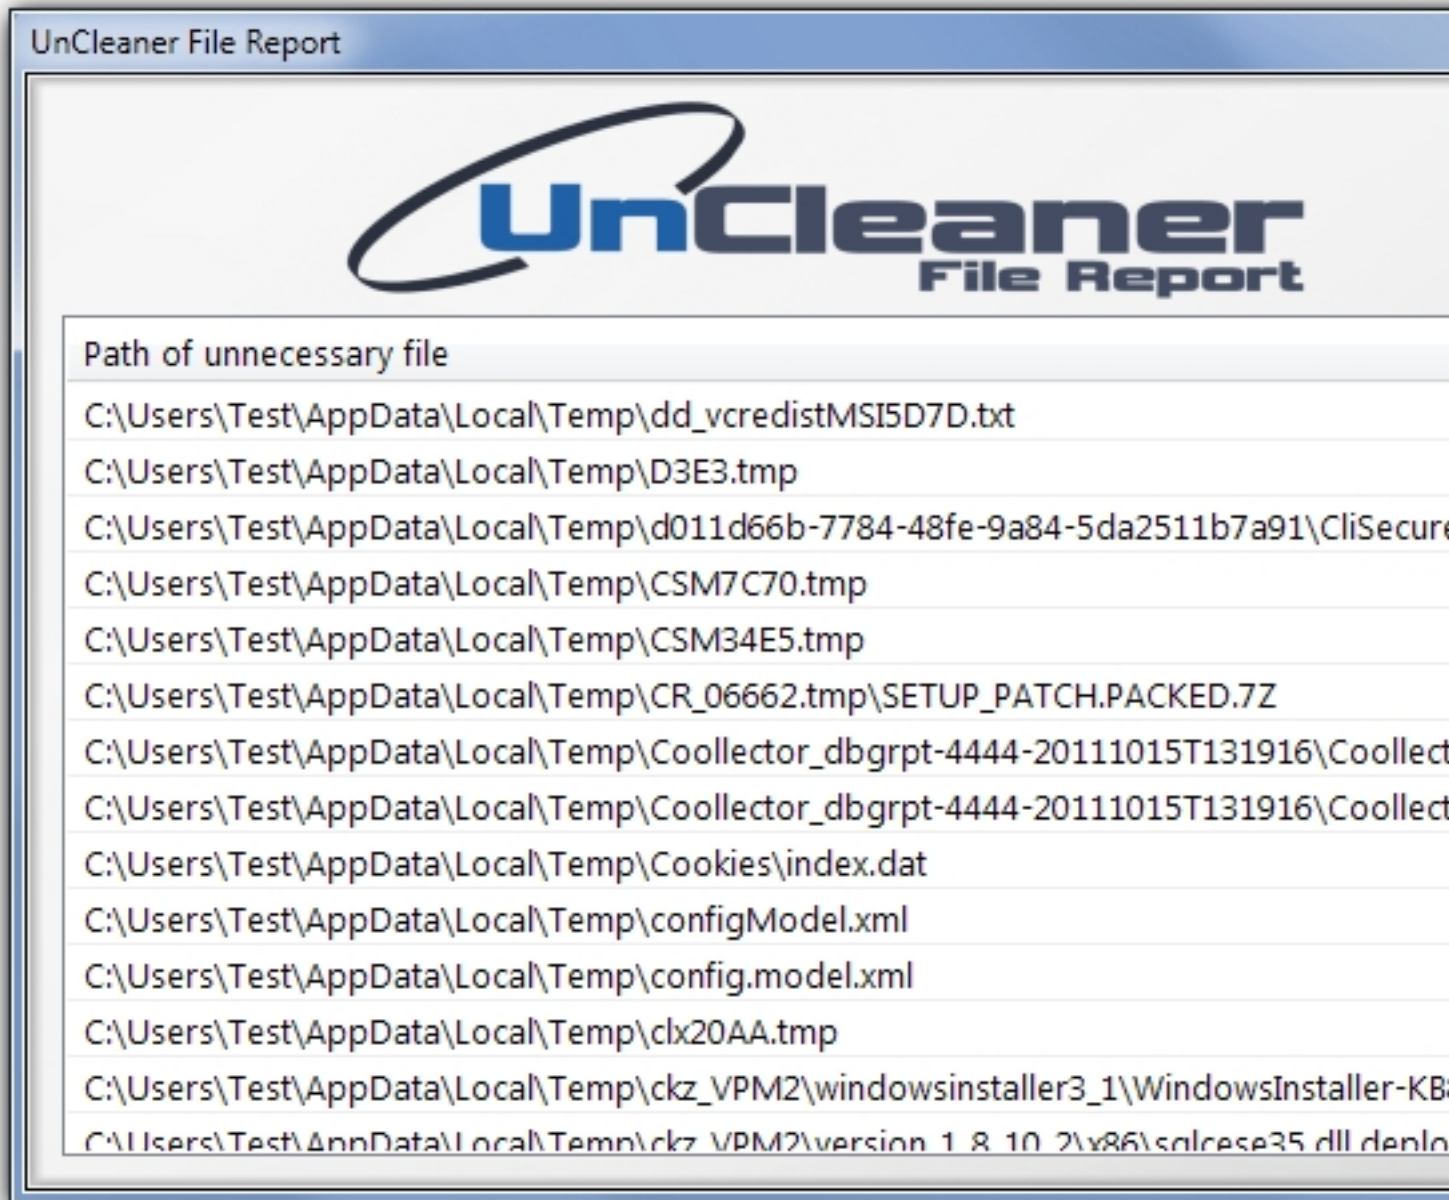

The interface displays the *Status* of your PC at the top, and suggests to clean your PC in case you have a lot of junk files. Other information include *Total Size, Total Number of Files* and *Total Number of Folders* of junk. At the bottom, there are buttons for *Clean, Schedule, File Report* and *Refresh* . To clean your PC, stop any ongoing downloads and click *Clean* .

Now you can schedule UnCleaner to check your PC for junk files on every startup by clicking the Sc

Click **File Report** button to view a complete list of all the unnecessary files and folders stored in

UnCleaner works on all versions of Windows, provided Microsoft .NET Framework 3.5 or higher is installed on your system.
