

There are so many image editors available for just about every platform; Mac, Windows, Mobile and web, and they are all, mostly, feature-rich. With so many options available, what can sometimes become frustrating is trying to do a simple image crop or resize and having to use either a heavy app to load, or figuring out a web app that will do the trick. Windows users have simpler options, like using the native Paint application, but Mac only ever had Mac Paint, and that, too, eons ago. **PaintBrush** is an [app](#) that gives [Mac](#) users their very own little [Paint](#) program. It is a very basic image editor that lets you create and save images in PNG, JPEG, GIF, BMP and TIFF. The app has a rich color palette, paint brush, fill color, add text, eraser, spray paint, invert colors and flip image tools.

The app's main interface comprises of a canvas and a toolbox. If the toolbox is hidden, you can show it from the *Window* menu. When you launch the app, you can specify the canvas size, which can later be modified from the *Image* menu. (Disclaimer: I didn't make the image below, and Heath Ledger rocks!)

The image shows a screenshot of the 'PaintBrush' application on a Mac. The window title is 'Untitled'. The main canvas displays a hand-drawn portrait of a character with long, dark, curly hair and a wide, red, jagged smile. The drawing is composed of various brush strokes, including lines for the eyes and nose, and textured areas for the skin and hair. On the left side, there is a vertical toolbar with various drawing tools such as a pencil, eraser, selection tools, and shape tools. Below the toolbar, it says 'Stroke: 3' and shows a brush size indicator. On the right side, there is a color palette window with a color wheel and an opacity slider. The background of the desktop is a blue and purple nebula pattern.
