

Only a few days back, we covered [Audiolip](#), a service that allows you to record micro-podcasts and share them with your buddies on different social networks.

Lalo.li

is a similar web application that lets you create short voice messages, which can then be emailed or shared on Facebook and Twitter. Lalo.li is basically a free text-to-speech tool that transcodes typed messages and generates a unique URL, which changes with every character that you input. This URL can then be shared with anyone through various platforms. When the recipient visits this link, the voice message is automatically played. Lalo.li does not require any login or sign up; all you have to do is type your message, adjust the

Amplitude, Pitch, Speed

and

Word Gap

settings, and share it with others

The service has a rather bland – perhaps too bland – interface that comes with a text field, play button and sharing options. To start off, simply type a message and set the *Amplitude, Pitch, Speed* and *Word Gap* parameters. You will notice that the URL in your browser's address bar changes as you type. Once you've keyed in your text, you may either hit the Twitter or Facebook buttons to share it on the respective networks, or simply copy-paste the link and send it to anyone you like. Since the URL is quite lengthy, you might want to use a URL shortener.

Lalo.li

Short Voice Message Service

What a nice day!
