

If you've been playing around with Windows 8 beta versions (Consumer Preview or Release Preview), then you must have noticed that the Windows 8 native Reader app doesn't allow you to print PDF documents. **PDF2Printer** is a small application for Windows 8 that offers a quick way to print your PDF documents. It lets you integrate Print command into the right-click context menu for PDF files, allowing you to quickly select the printer you want to use to print your PDF document. In addition, the installation package also contains

*batch PDF print*

utility, which lets you print multiple PDF documents in one go as well as send selected PDF files to Virtual Printer application. Details after the jump.

By default, the application doesn't add Print shell extension to the right-click context menu. After the installation, open *PDF2Printer Configuration Manager* and enable *Shell Integration (add a Print menu for PDF file type)*

option. Here, you can also tweak some other settings. For instance,

*Target Printer*

section allows you to define the action of Print command and includes

*Show Print Dialogue to choose a printer*

,

*Hide Print Dialogue and use system default printer*

and

*Hide Print Dialogue and always use the following printer*

options. You can set page scaling to

*No scaling, Fit to page*

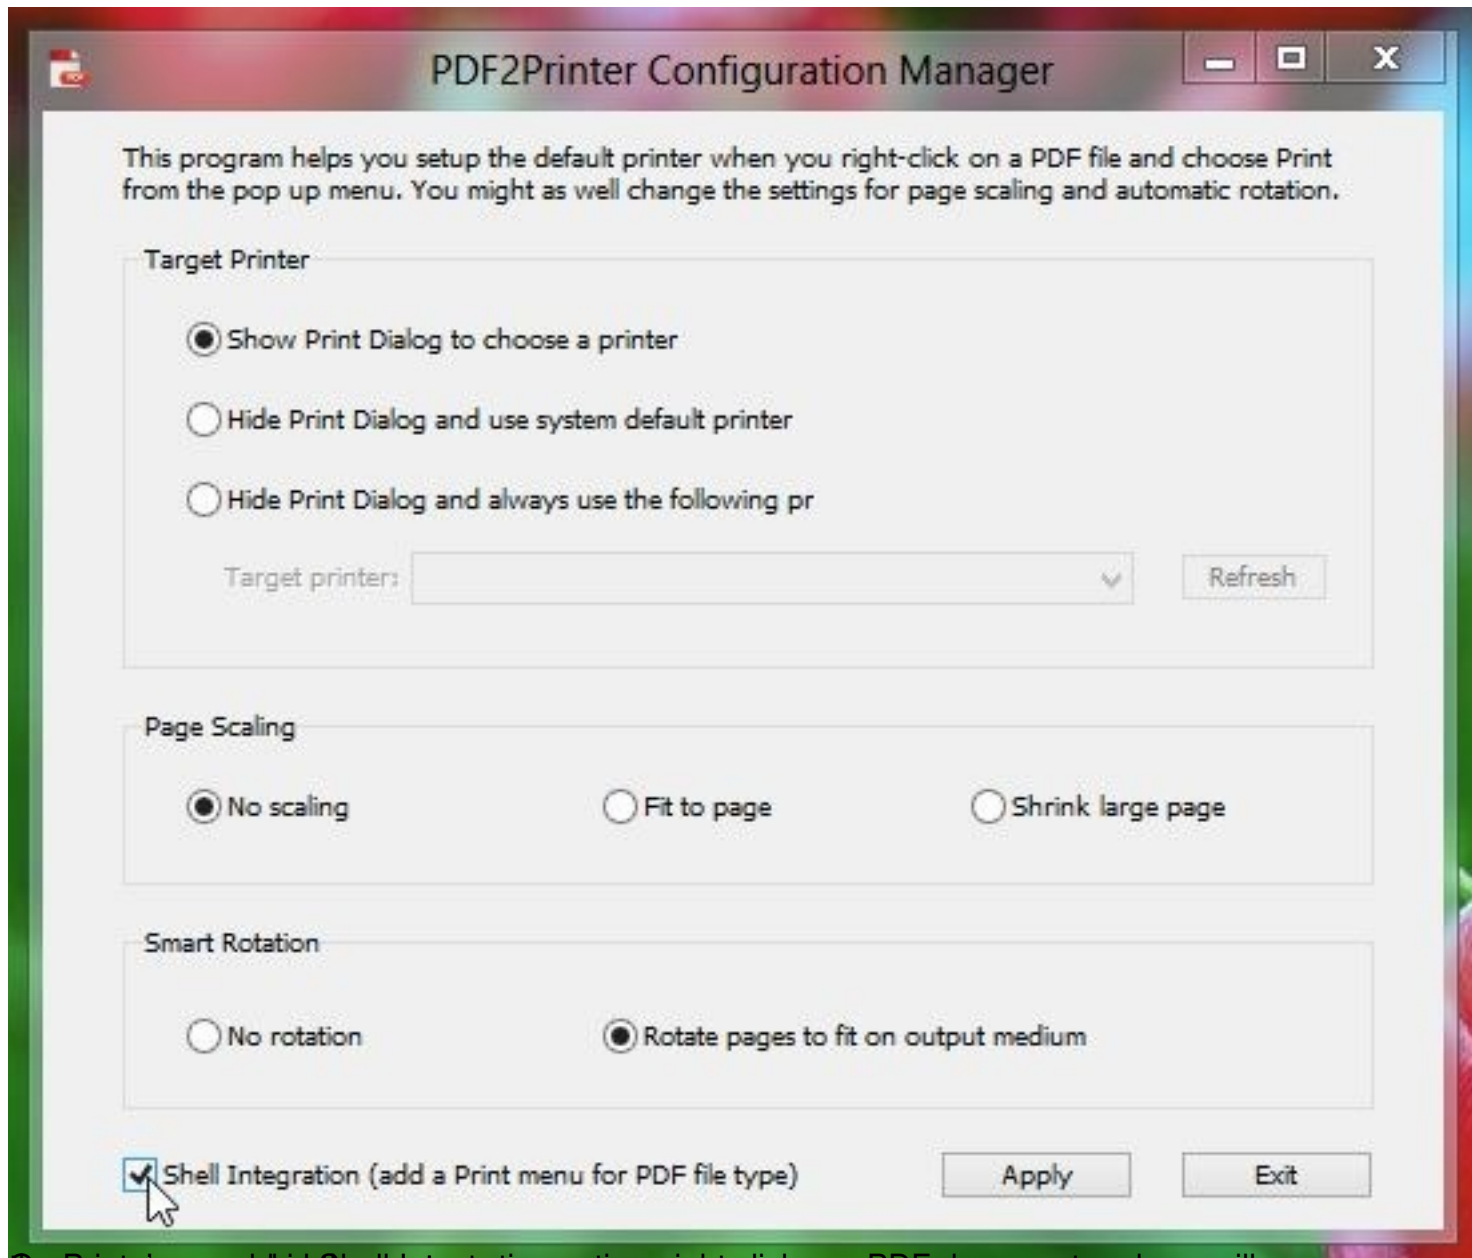

and

*Shrink large page*

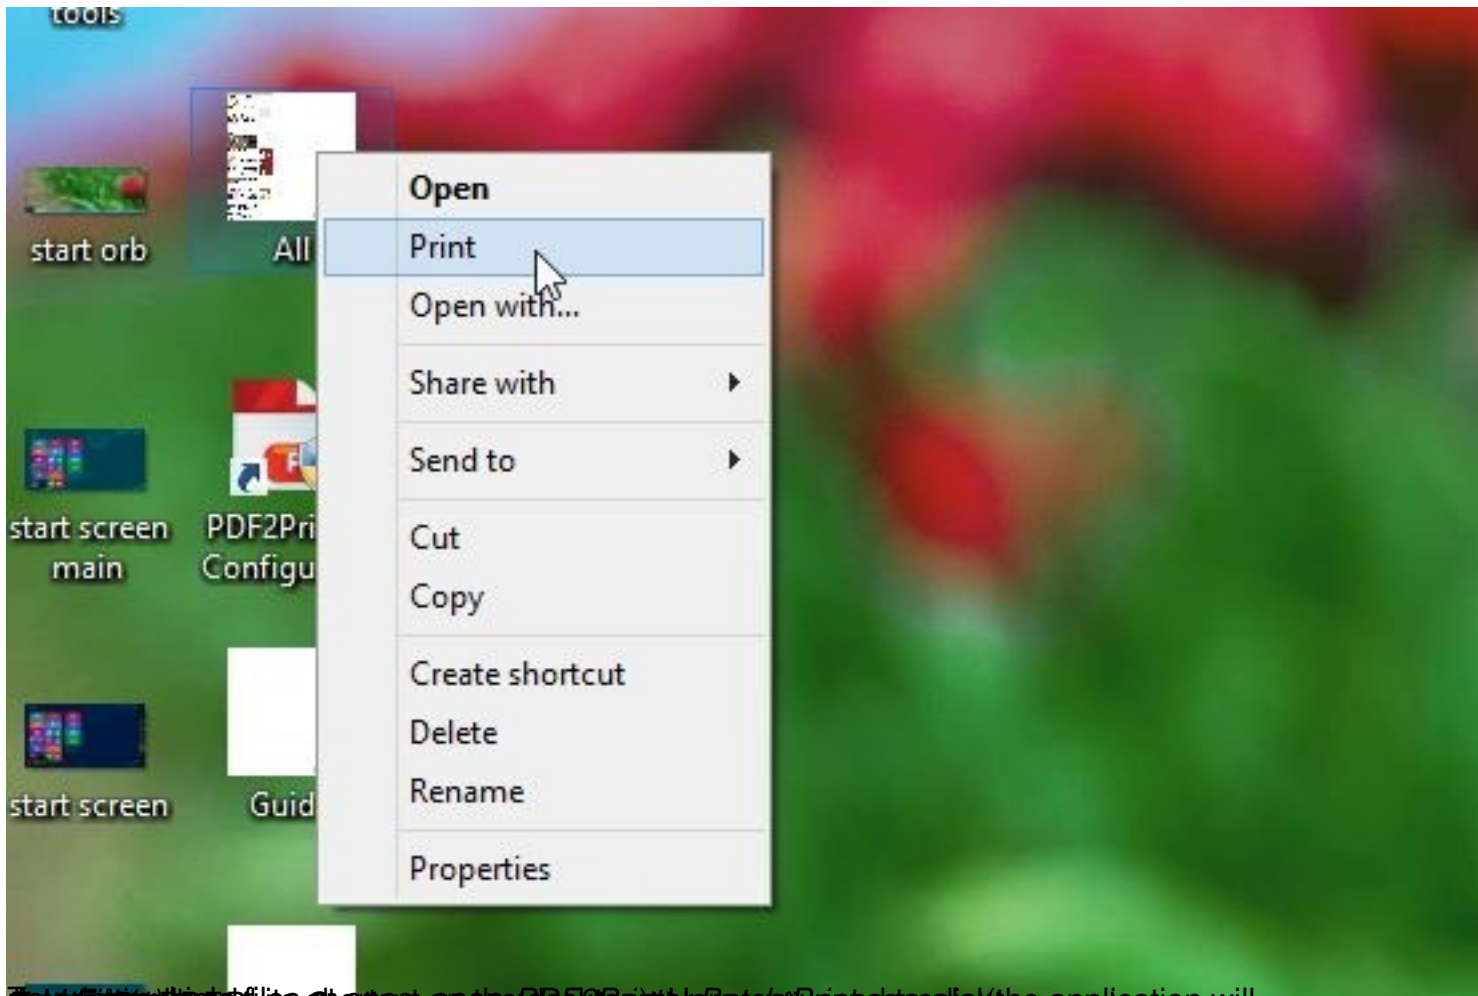

. Finally, there's also a

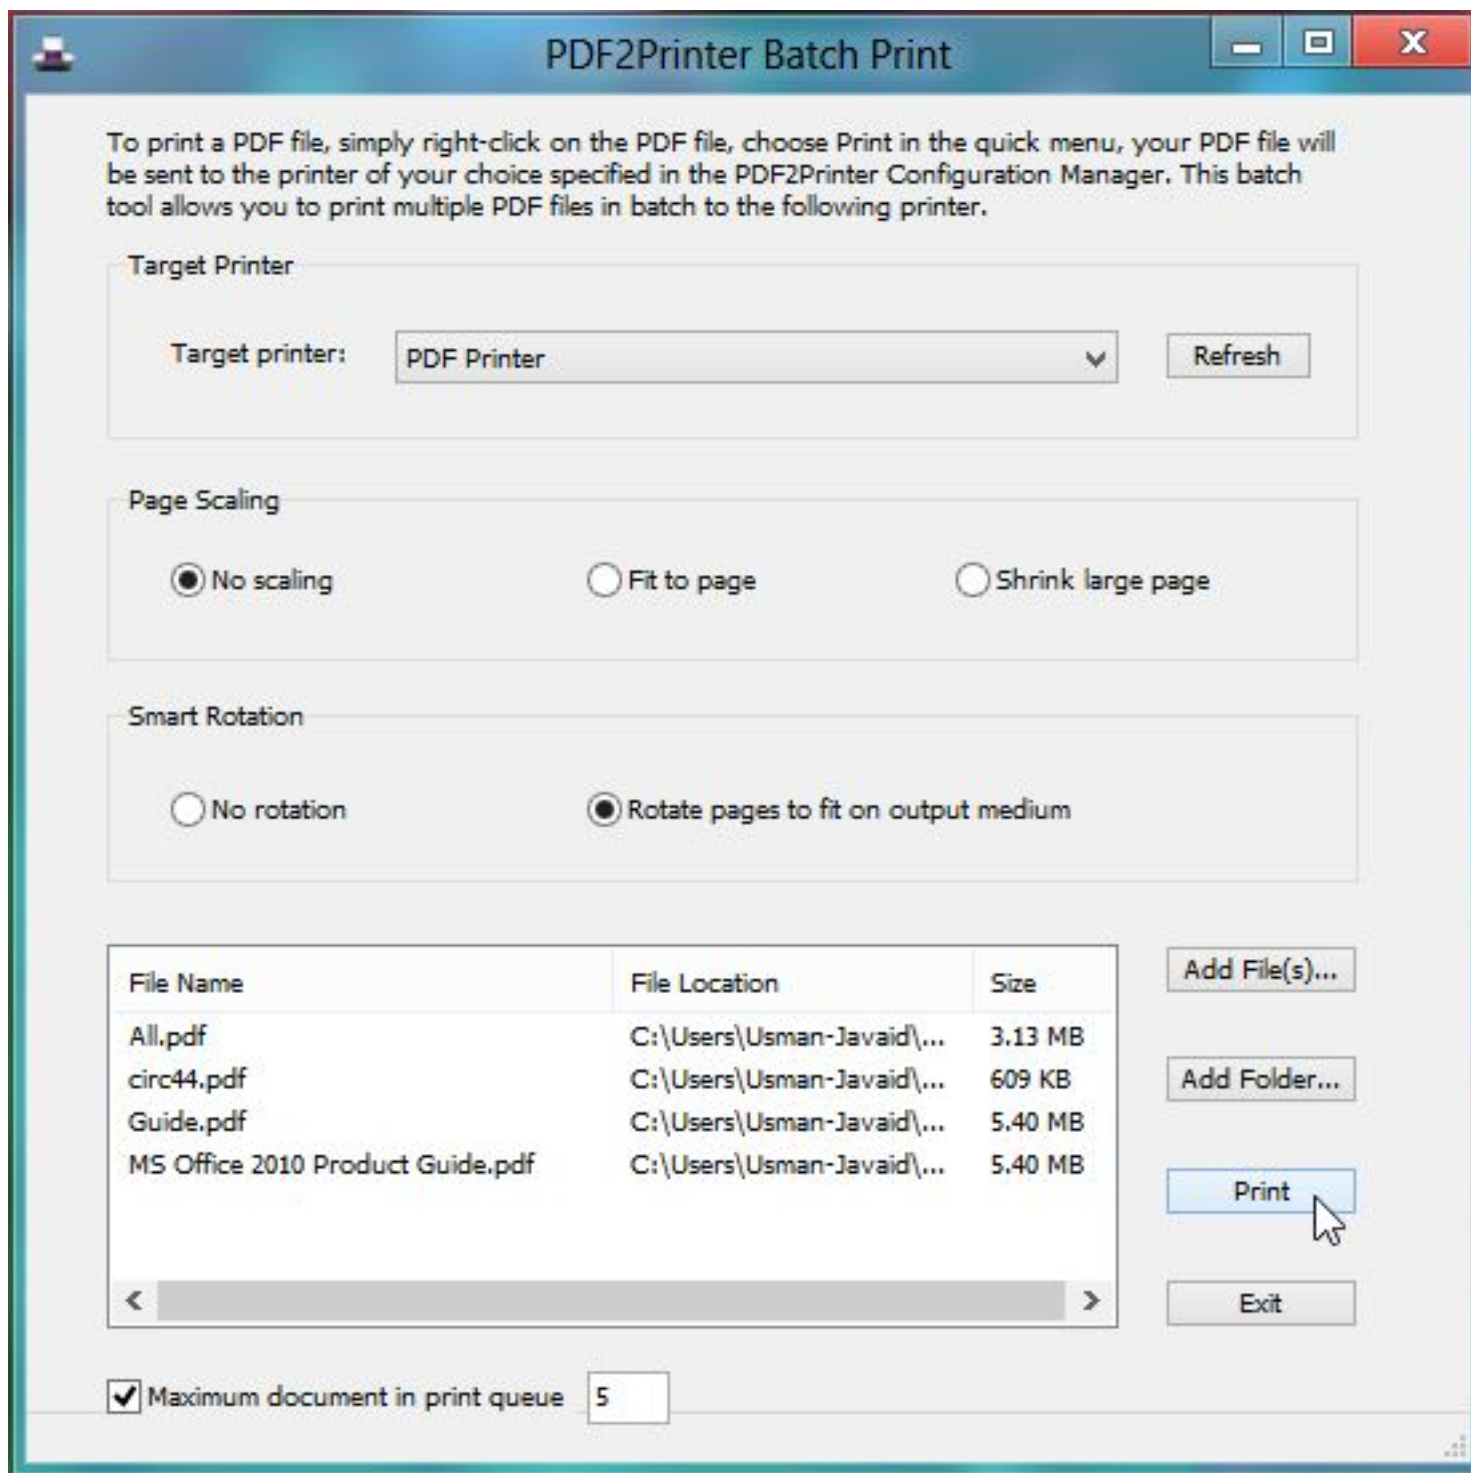

*Smart Rotation*

option.

Once you enabled Shell Integration option, right click any PDF document and you will see

PDF2Printer is available for free and works on Windows 8. Testing was done Windows 8 64-bit
