

We've covered a lot of clipboard managers that extend the functionality of the Windows native clipboard manager by allowing users to save the copied items into different data type-specific categories such as text, rich text, image, file etc. Since the default Windows Clipboard holds only one item at a time, you can use third-party clipboard tools to save multiple items as well as retain the clipboard data, even after a system reboot. Today, we came across a clipboard tool called **ControlC** that works in a slightly different way. It saves all the clipboard entries, including Text, Images and Files, and allows you to view the history database from a web browser (localhost). The application provides a minimalistic web app that runs on a localhost, allowing you to view your clipboard data from remote locations. Moreover, the clipboard history database is secured with a password, and only the authorized users can view the copied items. More on ControlC after the jump.

After installation, the application runs in the background. An icon for the program is added to your system tray. When the application is running, it automatically saves the items that you copy to clipboard. You can right click its system tray icon and select Show History to view all the saved clipboard items.

The data can be viewed in any browser window. After clicking the Show History, you will be taken to the web interface of ControlC. Just enter your password to view the saved clipboard contents.

Please enter your password:

 A password input field containing five black dots and a vertical cursor line, followed by a "Login" button with a mouse cursor pointing to it.
