

Amazon Cloud Player caused quite a stir when the service [was announced](#) for the web and Android last year. Since then, the online music storage and streaming service from Amazon has received favorable reviews from users all around the US, which is perhaps why Amazon has finally decided to increase its userbase beyond the aforementioned platforms to iOS. We know that it is said about a lot of apps out there, but Amazon Cloud Player really does have the potential to give iTunes a run for its money (as a music management tool). Just like the Android app, the iPhone version of Amazon Cloud Player comes with a full-featured music player that can be used to create and manage playlists as well. However, the killer feature offered by the app is its Amazon Cloud Drive integration. You can easily transfer songs from your PC or Mac to your iPhone via the Amazon Music cloud service. Not only that, you can even choose to stream music from your cloud storage to your iPhone without having to download anything, and the app comes with Bluetooth support, making it a true match for the stock Music app.
