

We've previously covered two apps for Mac, [Droppy](#) and [DragonDrop](#), both of which make it convenient to drag & drop files or folders between desktop spaces. Both apps carry a price tag, and while their interface is excellent and they work without any glitches whatsoever, there is still the fact that you have to pay for a very basic sort of functionality.

### **Cut with Drag & Drop**

is a free Mac app that is somewhat similar to both the former apps. It won't help you move files between desktop spaces; rather, it provides a docking station for moving a file or folder to a new location.

Cut with Drag & Drop works from its Dock icon. Select the file or folder (you can select as many as you want) that you want to move, and drag & drop it onto the scissors icon. The icon should appear with a green arrow pointing left, which shows that state of the app as ready to accept files and folders for moving. Once a file is added, the green arrow turns red and points in the opposite direction (to the right), with a numbered badge indicating how many files and folders are to be moved.
