

Many of us have been left awestruck after watching time-lapse videos where the flow of time can be accelerated in order to give us a better view of changes in areas of interest over time. Now, creating, modifying and processing time-lapse videos through your webcam has been simplified and made accessible through the **Webcam Timelapse** tool. Although this utility appears simple, it equips you with advanced functionality through features including

Daily SelfPic

Adjustable delay

Avi video creator

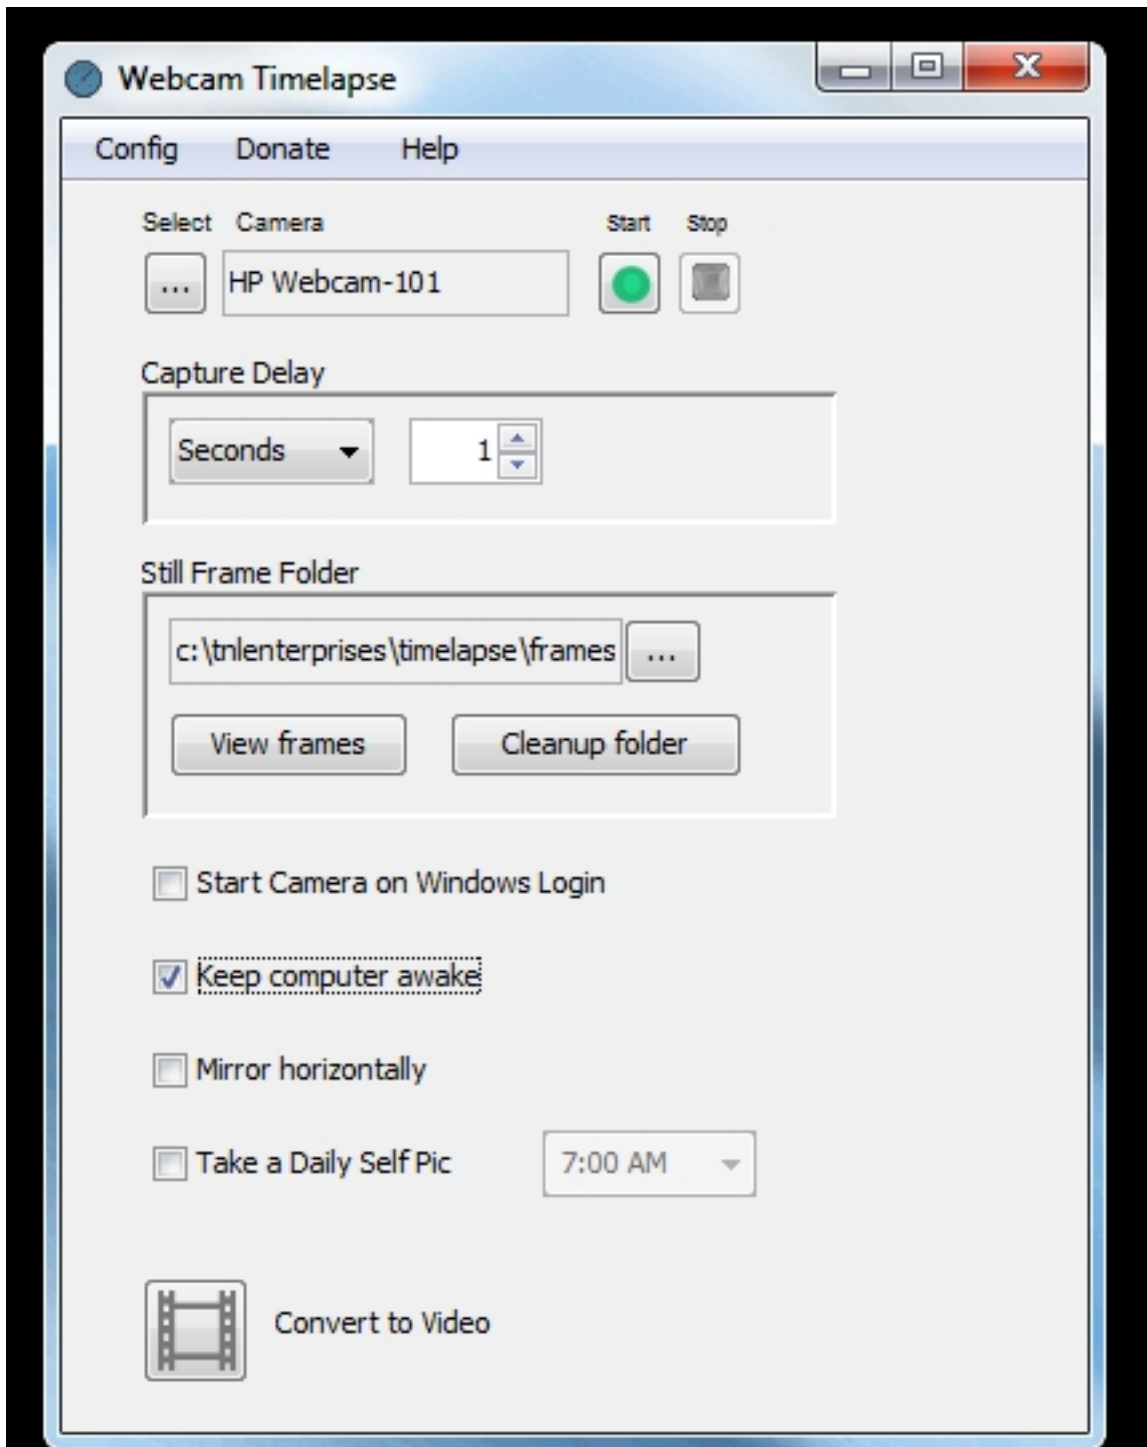

reverse video mode

manual capture mode and the like, making it relevant for time-lapse and stop motion applications. If you want to see yourself grow in age over the years, you don't need to consistently record all your activities anymore, just use the

Daily SelfPic

feature, which takes your picture at a specified time every day, so that it can be compiled for a final video time-lapse all through your webcam.

After installation, Webcam Timelapse automatically detects your webcam and allows you to access its features through the interface segmented in three areas in the active window: capture, frame processing and video conversion.
