

Working with multiple computers at a time requires you get up and go to the PC that you want to control. That can be both time consuming and irritating, especially if a person has to constantly keep getting up during some important work. There are applications available that let you avoid getting up from your PC again and again. It means that the same mouse and keyboard will be used to control all the connected PCs, saving you the trouble of getting up and moving yourself to be exactly in front of the other computer. Previously, we have covered some very useful applications for Windows that allow you to control multiple computers using a single set of mouse and keyboard. ShareMouse is one such [cross-platform tool that lets you share your mouse and keyboard](#) on multiple computers on the network, and [use Without Borders](#) is another alternative by Microsoft Garage. Today, we have another application, **Multiplicity** from Stardock, which lets you control up to 9 computers from one set of mouse and keyboard. More on Multiplicity after the jump.

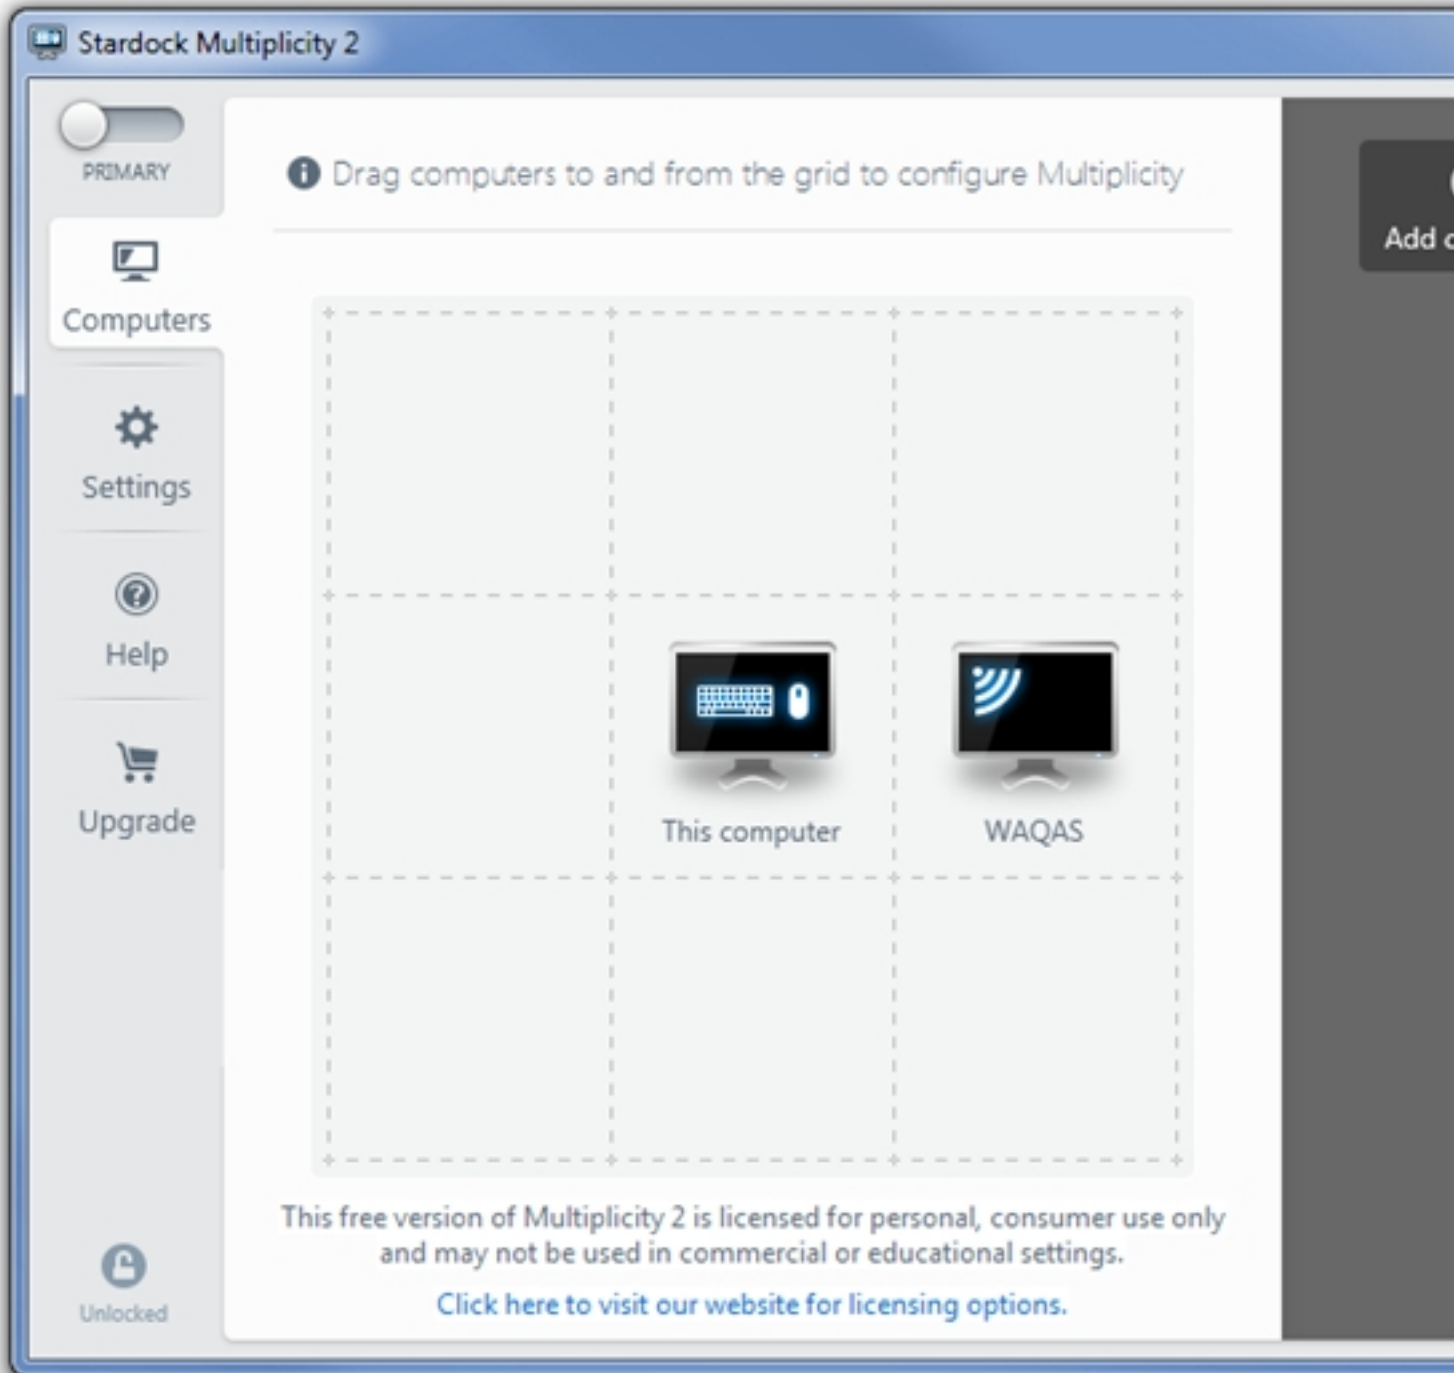

As with all applications from Stardock, Multiplicity also has an eye candy interface. When you install the application and run it for the first time, you will be asked if you want to set the Current PC as the Primary Computer or the Secondary Computer. Set your main computer as the Primary Computer; this allows you to control all the Secondary PC's without getting up. Now, to add a Secondary PC, click Add computer available at the top right corner of the configuration dialog box.

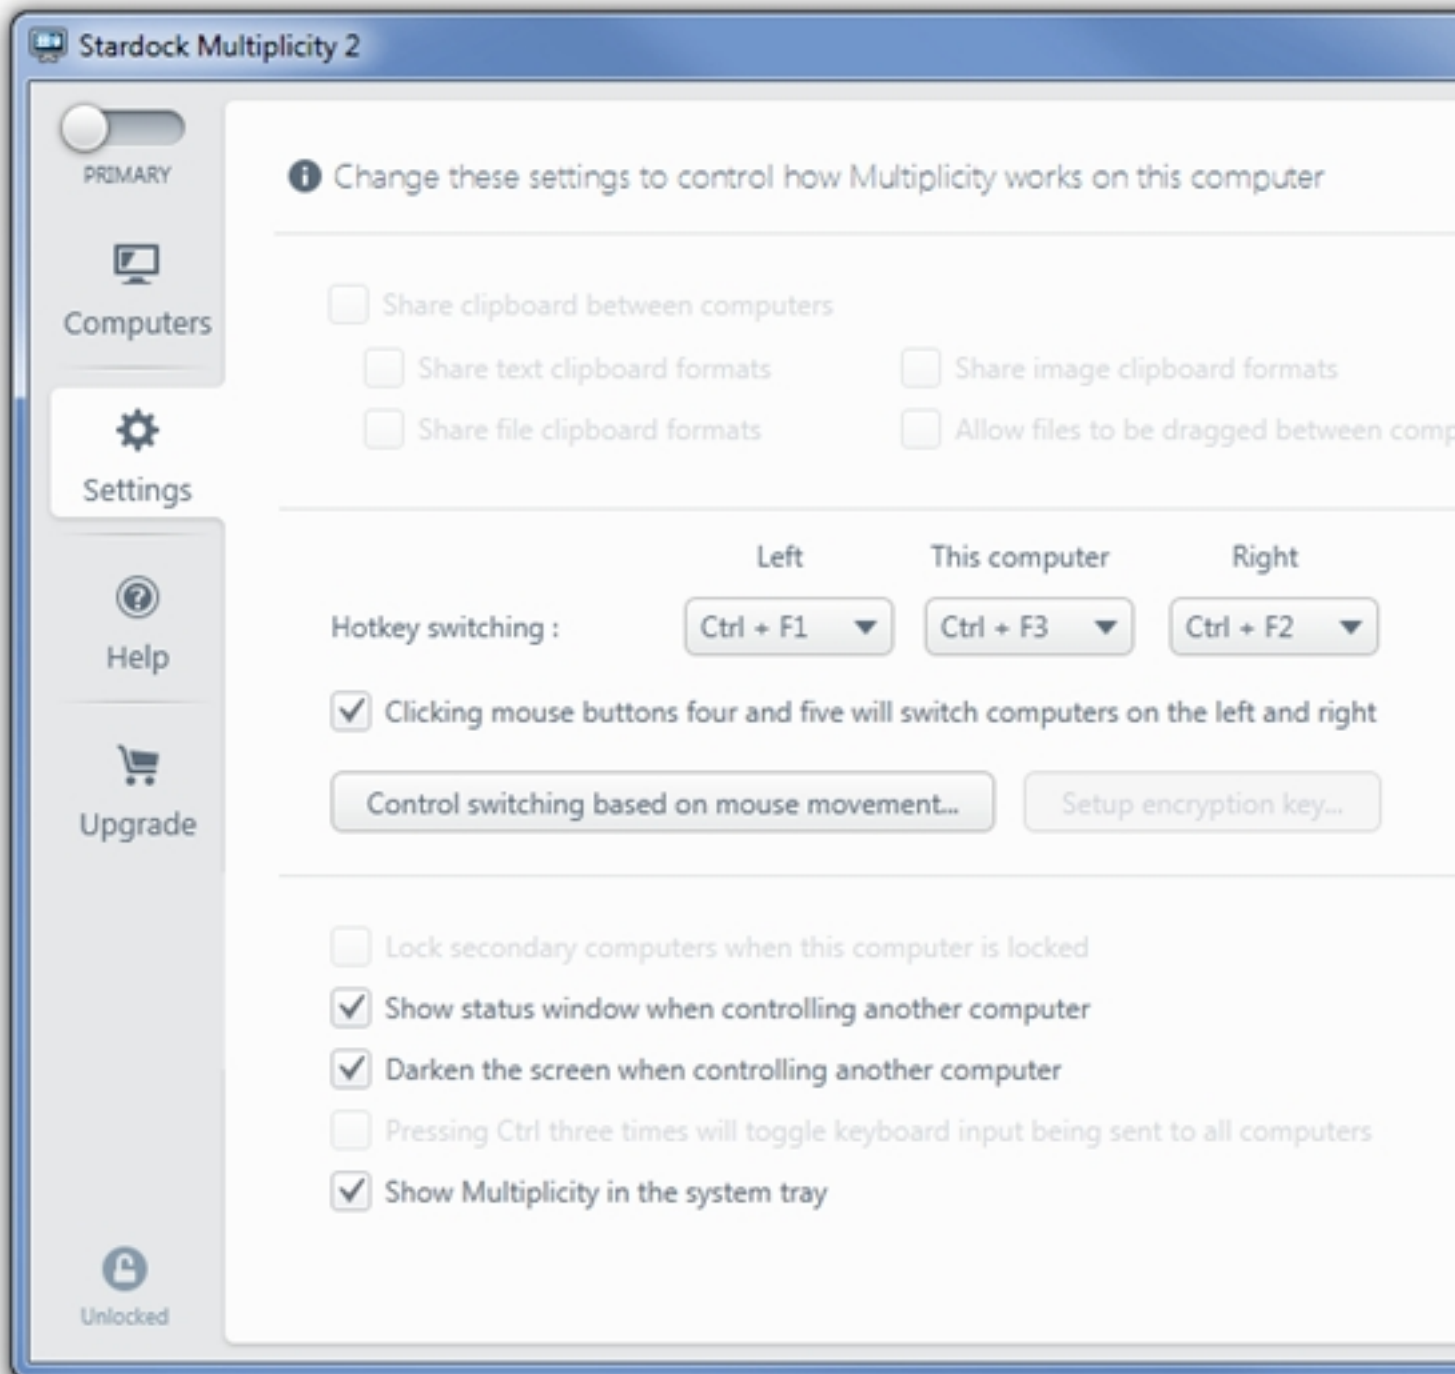

With a PC as the primary PC, you can control up to 9 other computers with one keyboard and mouse. The
