

Space and file size matter more in cases where data has to be transferred online, because there is always a limit and because sending large files takes time and precious bandwidth that you may be short on. As far as your local hard disk is concerned, time isn't a issue, but space still matters; however, files can't be kept in an archive format all the time. They will have to be extracted each time you want to access them and will need to be recompressed once you've made changes. **MoreSpace Folder Compression** is a Mac app worth \$0.99 in the Mac App Store that compresses files but does not add them to an archive. Files are kept in their original format and compression is on the HFS+ system. The app actively monitors any folder that you've added and compressed for changes, and when a change is detected, i.e., items are added to a folder, the app will compress the new items. In addition to compressing any folder you choose to add, it will also compress your email.

The app's interface and usage are simple, and two buttons at the bottom let you add a folder or your email folder. Compression begins automatically when a folder is added. It can be cancelled mid-way by clicking the *Cancel* button that appears during compression, or it can be rolled back by clicking the *Uncompress* button that appears once compression is complete.
