

The human brain is a funny thing; it has the ability to remember the most horrific and embarrassing things about your life but will immediately forget something important and crucial. To deal with this behavior, people do everything from setting up reminders to using sticky notes and even tying strings around their fingers. What's common among most reminder apps is that they are meant to remind you something at a defined time but forgetfulness doesn't always give you a date. You might be working on something and perhaps you have a great idea that you need to get down on paper but get called away from your desk before you can. **Sticky**

**Notifications** is a free Mac app (with a paid version available for \$3) that is a reminder app for the present. The app is for recording an idea that you can easily view via the Notification Center the second you return to your desk. The free variant has no ads but will remind you occasionally to buy the full version.

Sticky Notifications adds an icon to the menu bar. You can access the app's preferences and add new reminders from it. Visit the preferences first and choose if the reminders should be sent via Notification Center or Growl. The app supports both so even if you haven't updated to Mountain Lion, you can use the app without a worry. You can also set a hotkey to quickly add a new reminder from the *General* tab in preferences.
