

Have you ever copied an important link or block of text, and before pasting it, copied something else over it accidentally? Due to the limitation of Windows' native clipboard manager, which holds only one item at a time, most users rely on third-party clipboard managers to extend its functionality. If you've been looking for an application that can show you all copied text items, and let you choose the ones you need, we recommend giving **Clipomatic** a whirl. It's a simple clipboard manager for Windows that offers both

hotkey

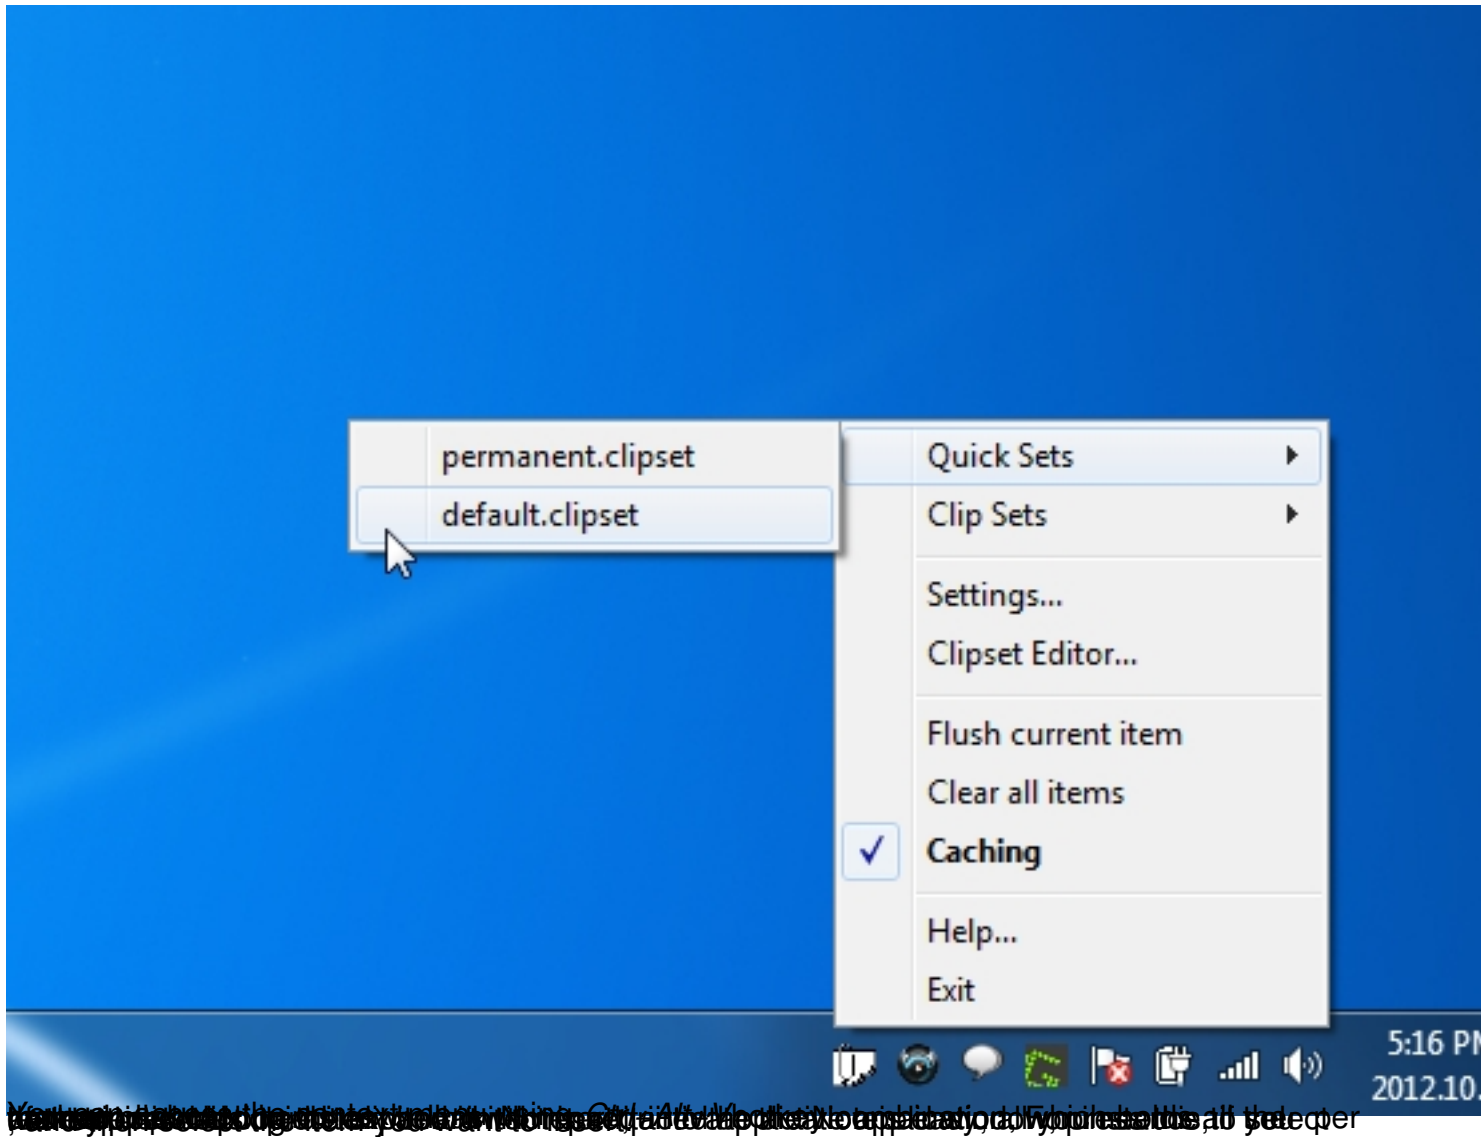

and context menu support, allowing users to quickly paste the text into required applications.

What makes it unique from other clipboard tools is its context menu, which gives one-click access to all the text items that you copy to the clipboard. Sadly, the tool doesn't support image and rich text format, though, you could turn lack of support for the latter to your advantage by using the tool to remove formatting applied to copied text. Another noteworthy feature is its ability to save most frequently used text snippets as

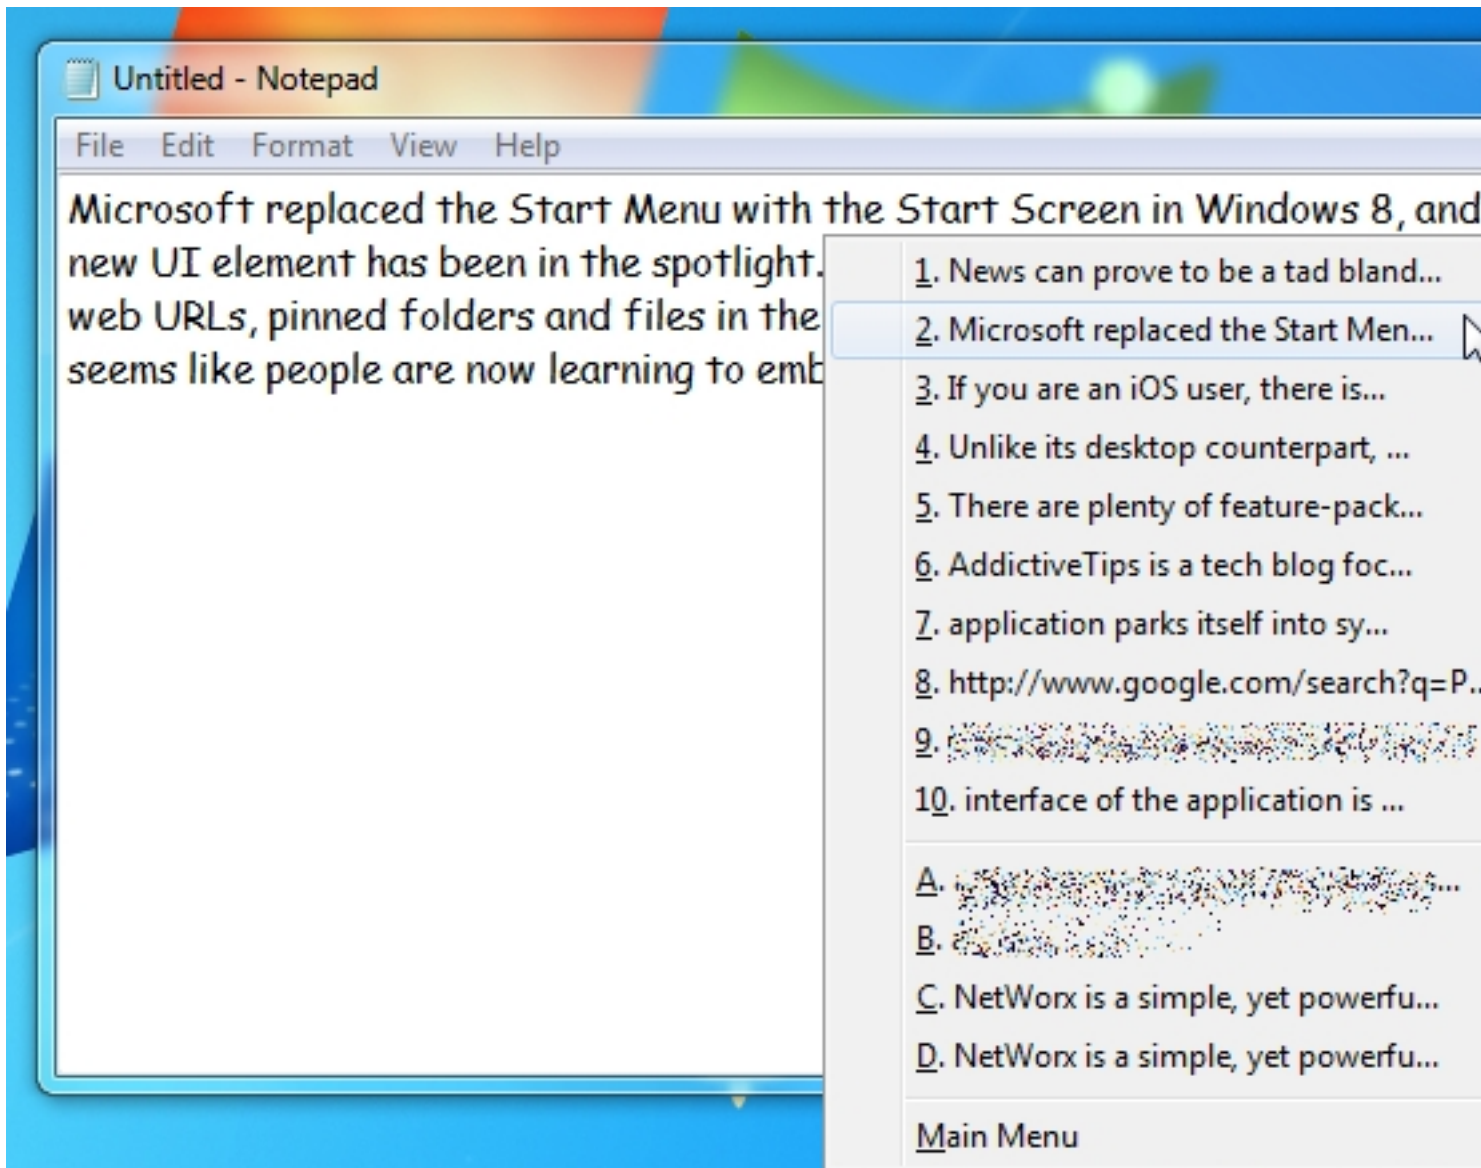

Permanent Text Items

, so that you can easily access them from its context menu.

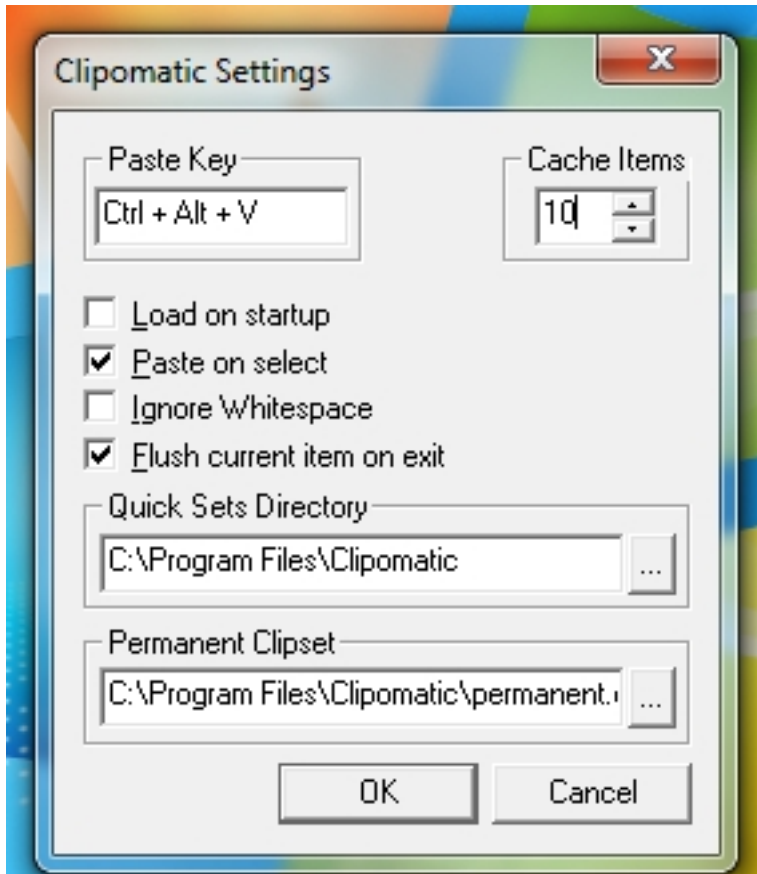

The application parks itself in the system tray after being launched. The system tray menu allows you to start and stop clipboard caching, flush all current text snippets (except permanent ones), bring up Clipset editor, and open Settings console. The number of snippets you want to hold can be changed from the settings. The maximum number of snippets it can hold at a time is 64.

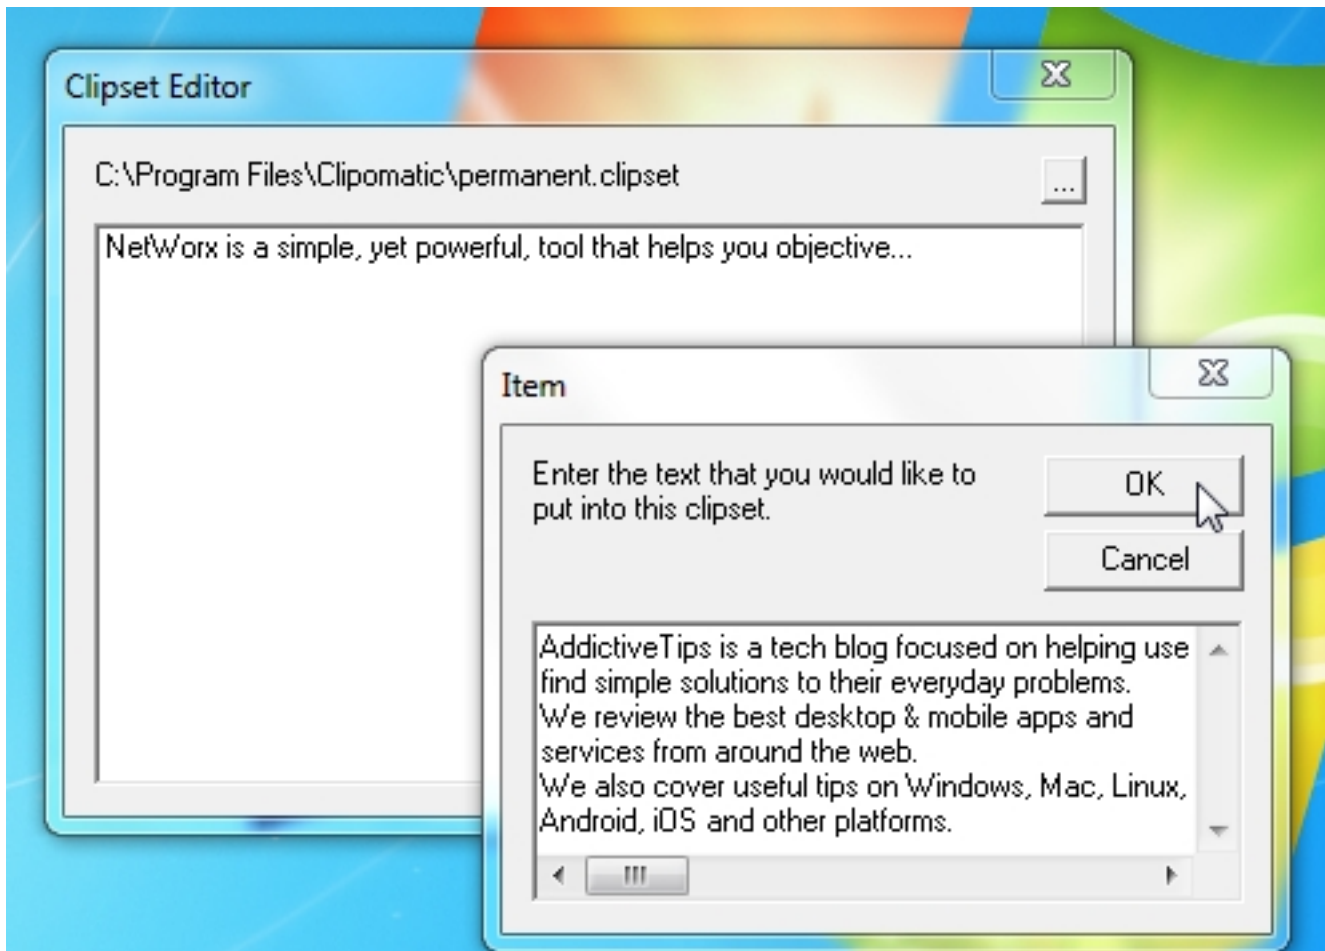

Video: How to Use the Windows 7 Clipboard to Save Clipboard Text As Permanent Snippets

The following window, the **Clipomatic** application, allows you to click on the predefined hotkey and the mouse cursor to be placed on the clipboard text.

To add a new item to the permanent clipset, first select Quick Sets on the menu bar, then from the Quick Sets menu, click on the option to save to permanent, or simply save the permanent
