

Word processing apps and photo editors are pretty useful for iOS users, but nothing brings more wow factor to your iPhone like an app that measures real-life, analog parameters. **SpeakerTweaker**

is among the most useful utilities for iPhone we have seen for a while. The app can be used to measure the quality and condition of your speakers, headphones or any other sound system, and that too without requiring any effort on your part. All you have to do is plug the speakers into your iPhone and run SpeakerTweaker. You will be provided with a detailed logarithmic graph along with a score depicting the performance of your sound system. You can then boast of your sound system's proficiency by sharing these test results over social media or via email.
