

We covered **Nitro PDF Reader** back in 2010. It was a PDF reader well ahead of many others at the time, even Adobe's own software. The reader is more than what its name implies; it allows users to edit and create PDFs and that's something that very few free PDF readers do, let alone doing it well. Nitro PDF Reader has just released a new version, version 3.0, that comes with four new features and a few enhancements to existing ones. The most significant features include the option to align text better when you're creating a PDF file or insert text into an existing one, auto-recover a file you were working on when your system crashed, detect and indicate if a file is an image-based file or a scanned document, and lastly, for large enterprises, Nitro PDF Reader has implemented Autonomy WorkSite Integration. Enhancements for Japanese and Chinese text, detecting and opening links to PDF pages, reduced file sizes when text is added to a file and saved and better PDF rendering have been added.

The features and enhancements that matter to most end users are text alignment and auto-recovery. When you open a PDF with Nitro PDF Reader and activate the text tool, you will see relative margins and outlines appear as you move the cursor around the text. It will give you an accurate idea where your text will appear.
