

Whenever you take out your iPod or launch a music player on your iPhone, Mac or PC, what is it that tells you to pick a particular song from the playlist? It's your mood; what you *feel* like listening to is usually connected to what you're *feeling*

. Wouldn't it be great if your music player could automatically judge what you're feeling and pick appropriate songs to match your mood?

PlayMood

is an iPhone app that works in conjunction with

PlayMood Remote

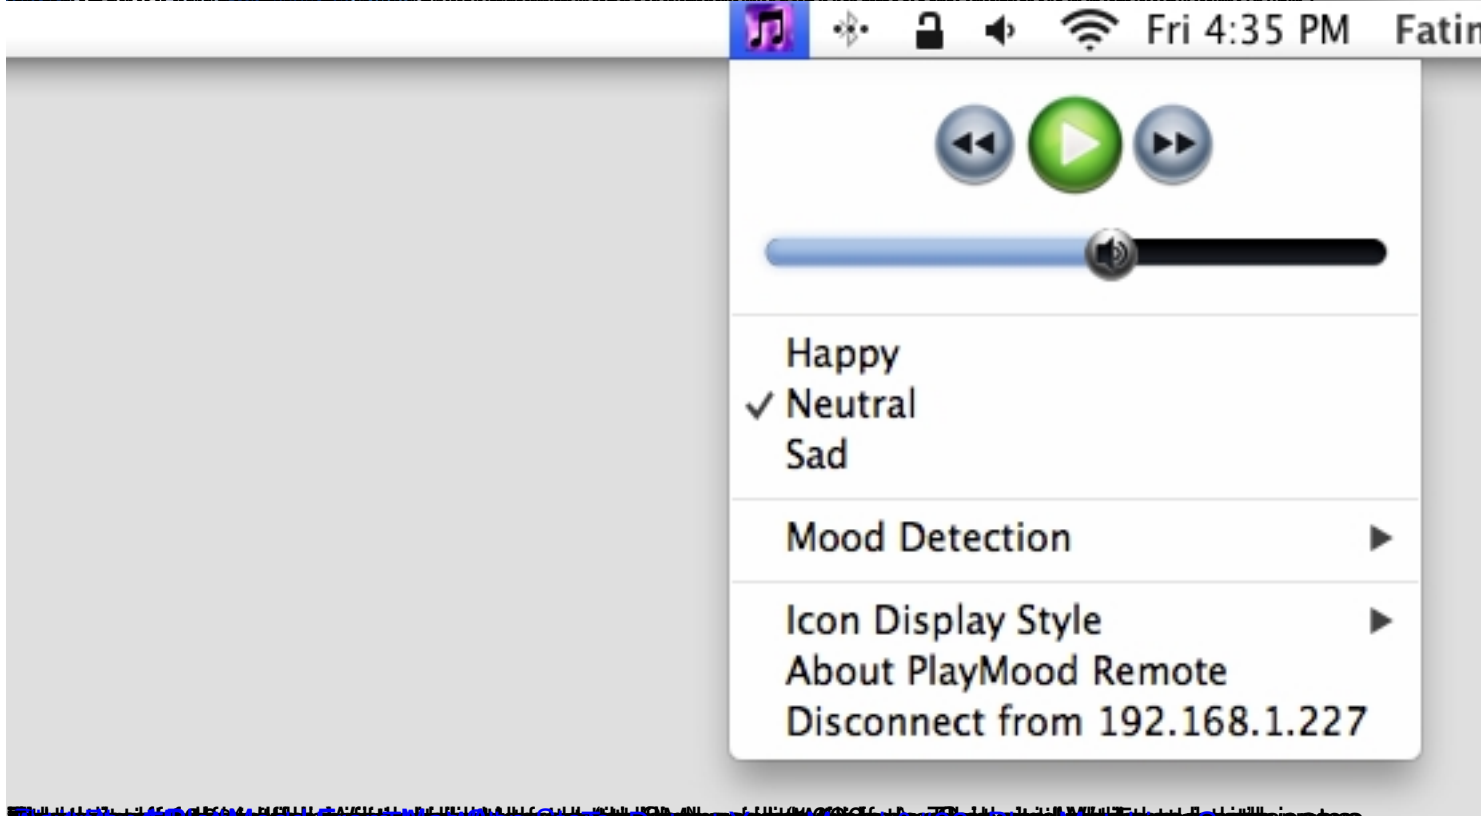

, a desktop app available for both Mac OS X and Windows. The iPhone app allows you to mark songs in your library as either happy, neutral or sad. The desktop client detects uses your webcam to detect your mood, and tells the iPhone app to play songs that you associated with it.

Install the PlayMood app on your iPhone and it will load songs from your iTunes library. For each song, select a mood. Remember that songs will be played on your iPhone, so set the loop or shuffle settings here. Use the next/previous button on the player to move to and rate the next song. The button on the left of the media controls allows you to change the mood and the camera shutter-like button on the right lets you turn mood detection on/off. Tap the little cogwheel on the top right corner to access the app's settings and connect it to your Mac or PC.

between the app, sky, and the original source of the data. The app, sky, and the original source of the data are all connected to the same WiFi for
