

The stock Camera app in iOS is devoid of almost any extra features, and while there are plenty of third-party replacements available in the App Store, no app can beat the convenience of using the stock one, with its lock screen shortcut, smooth results and seamless integration with the camera roll. If you've always stuck with the stock Camera app, but still feel a bit envious of all the extraordinary features on offer in third-party apps, you don't have to be torn between these choices any longer. What are some of the major features that you get with third-party camera replacement apps? These might include a countdown timer, independent exposure and focus selection, multiple kinds of grid overlays and the choice of selection a custom resolution for video recording. **CameraTweak** is a new Cydia release that adds all these features to the iPhone and iPod touch Camera app. In addition to these options, the tweak offers a time-lapse feature, and lets you choose a frame rate for videos.
