

Applying filters to photos after capturing them is good and all, but having real-time, pre-shoot image effects is certainly a lot more fun. There are many iOS apps that let you apply photo filters before you shoot, but we haven't seen one that does it quite as well as **Blux Camera**. Apart from sporting a unique interface, the app comes with a lengthy feature list and a little twist in the concept that drives most regular camera replacement apps. There are tons of photo effects available, which can be combined with any of the app's numerous capture modes to snap gorgeous pictures. You may choose a filter or mode of your choice, or let the app analyze the scene and automatically choose a combination for you using what the team behind the app, Blux Touch, calls P.E.A.R. (Photographic Environment Analysis and Recommendation) technology. Other features include filter and capture mode randomization, tilt-shift effect, burst capture, voice activation, multiple grid overlays; you name it, Blux has it!
