

Having too many programs installed in your computer can certainly slow it down. You may already know that applications, and their associated services running in the background, consume precious system memory that can affect your PC's overall performance. For the same reason, some PC-care applications notify you if an installed tool hasn't been used for a long time and suggest either suspending it (if it's running in the background) or uninstalling it from the system. One of the reasons most power users rely on application virtualization software is that they provide an easy way to run the application in an isolated environment. Not only does it reduce the chances of data theft and like threats, it also helps your system easily balance the resources shared by active applications. **Spoon** is a freshly-baked web application that implements this very concept using your web browser. It runs the applications in a sandbox-like workspace, enabling users to launch programs in a virtualized environment without actually installing them on their computers. Spoon includes different types of applications, each one with multiple versions to choose from, including Browsers, Games, Media Apps, Productivity Apps, Social Apps and Tools.

Instead of downloading and installing the apps, it allows you to stream them from the web and run as if they are installed locally. Since it restricts the apps to run only in its own sandboxed environment, you don't have to deal with different installation-related errors. Moreover, you can run Java and .NET based tools without first installing the pre-requisites. It even lets you bypass any limitation imposed by the system, including the administrative restrictions, compatibility errors and UAC notifications. You can also run the apps directly on secondary computers by just copying them on an external hard disk or USB drive.

In order to use the web app, you need to create an account. Enter your name, email address and password to sign up for the service.

## ABOUT

**Make phone and video calls anywhere in the world for free.**

Skype uses innovative P2P (peer-to-peer) technology to connect you with other users worldwide. Features include SkypeOut calling to regular and mobile phones, conference calling, secure file transferring, and the ability to put contacts and conversations in tabs for easy access, all through a single-pane interface. Skype calls have better sound quality than your regular phone and are highly secure, with end-to-end encryption. Newer features include up to 5-way group video call, a redesigned calling experience, and an improved video snapshots gallery.
