

While an iPhone can be much more effective as a recording device due to its smaller size, it is the iPad that most people use for work and academic purposes. Maybe that is why **HT Recorder** is only available for the iOS tablet. The app lets you record clips that are hours long, share them with ease and even edit them using some really simple controls. If you are thinking that it will be a little awkward holding your iPad in front of someone's face while trying to capture every word they say, think again. HT Recorder catches any sound within a normal-sized room, even if the sound is no more than a creak or a whisper. The app offers amazing volume balancing, meaning you will get a clip that won't force you to keep adjusting your device's volume again and again.
