

There are two things you can find in abundance on the internet; bad grammar and grammar Nazis. English dominates when it comes to the internet and there is little tolerance for bad spelling and incorrect usage of words. Spell check in your browser has probably saved you tons of embarrassment when it comes to emails and social media updates but it has its limitations and the dictionary that browsers use isn't really updated frequently leaving out many words that evolve to become part of everyday language. **Smart Spellchecker** is a Chrome extension that is a feature rich spelling, grammar and punctuation checker for your browser. At the backend, it relies on the Grammarly web service which has several additional features that help you write better including a plagiarism checker. As a browser extension it provides you definitions, synonyms, and live spelling and grammar check for multiple services like Gmail, Facebook, Twitter, Yahoo, WordPress and Blogger.

Smart Spellchecker integrates within the browser, you won't find extra options for it either in the right-click context menu or in the form of a button next to the URL bar. Once installed, you will need to provide your email address in order to activate it. After activation, go to Facebook and type in a status update or write a new email in Gmail. At the bottom of both the text input boxes on Facebook or Gmail you will see a little green G badge. This will change to reflect the number of mistakes it's found in what you've written. The mistakes are highlighted with a red squiggly line. When you move your mouse over a mistake, the correct word and an explanation of your mistake is displayed in a pop-up box. The information is cursory and a link is provided at the bottom if you want additional details on the correct usage of a word.
