

[iOS 6's panorama mode](#) might be the most underrated feature to come with the platform's latest update. A lot of apps allow users to capture panoramas pretty impressively, but having this feature in your iPhone's stock camera really kills the competition. Despite all its awesomeness, the panorama has a glaring omission: you cannot use it unless the ambient lighting is perfect. When shooting ordinary photos or even videos, it is possible to turn on your camera's flash any time you want, but the option is strangely missing in panorama mode. So, yet again, Cydia has to come to the rescue! **Flashorama** is a new tweak that adds the flash toggle to the panorama view in iPhone. You can control the flash before beginning to shoot, or even while moving the device around to capture the panorama.

As Flashorama has been designed to work with the stock Camera app, only download the tweak if you own one of the following devices:

- iPhone 4S
- iPhone 5
- iPod touch 5G

Also, you need to be on iOS 6 to make everything work correctly.
