

The importance of front-facing cameras in smartphones has increased manifolds due to apps like Tango and Skype, but there are other perks of having cameras on both sides of your phone. Front cameras make sure you don't have to hand your device to strangers when you want to take a picture of yourself, or even use the front cam as a handy mirror every once in a while. Despite all these advantages though, there are some things that even two cameras can't accomplish. While taking a group photo, there always has to be one person who is forced to assume the responsibilities of a photographer and is left out of the picture. iOS and Android already have a few apps that can solve this problem by simultaneously activating front and rear cams to take a photo with both views. [Signature Camera is a perfect example](#) of this, while [ey eReport is based on the same principle](#) as well. It is good to see that a similar app is now finally available for Windows Phone. With **Dual Cam Photo**, users can easily add a shot from the front camera every time they take a picture from the rear one.
