

All it takes is a single app or tweak to bring a certain genre back in vogue. Prior to [the release of JellyLock](#), there hadn't been a similar tweak released in the Cydia store for a long time, but now we have an even newer way of adding useful app shortcuts to the iOS lock screen.

atom

lets you pin six apps to the lock screen, and to make sure you don't end up launching them by mistake, it uses a clever dragging gesture to get to the shortcuts. To make the unlocking mechanism conforms to the rest of the tweak, atom adds the unlock shortcut in the middle of the app icons, which looks pretty neat. atom might not have as many [customizing options as ICSLock Pro](#), but its default look is good enough to keep most users satisfied.

[Atom Adds A Sleek Custom App Launcher To The iPhone Lock Screen](#) [Hamza](#)
